

ICVERIFY® for Windows® Enterprise Edition 1.5

ICVERIFY®

www.icverify.com

Imagine the effectiveness of having a single server to handle card payments for your Web store, sales department, customer support, voice response system and physical stores. ICVERIFY® for Windows® Enterprise Edition software addresses the needs of small to enterprise-scale e-commerce, mail order and retail merchants who wish to host their own payment processing. The ICVERIFY Enterprise software offers superior performance and reliability, supporting dial-up for smaller scale merchants, Internet for mid-range and larger users, and frame relay connections.

With ICVERIFY® Enterprise Edition, you can:

- Create, delete, import, export and other transaction/batch management functions
- Utilize client/server architecture allowing multiple users on a LAN to access a single server, which has the common connection to the bank network
- Program with interface languages such as Active X Control, Java™, C++; integration with SAP R/3 also available
- Submit even the largest transaction volumes (benchmarked at 20 transactions per second, sustained load.)
- Utilize address verification and CVV2 / CVC2 / CID for e-commerce, retail and mail order
- Send transactions to payment processors with secured sockets layer (SSL) protocol and VPN Internet access
- Manage software access through a powerful user manager interface
- Process authenticated e-commerce transactions through support for Verified by Visa™ and MasterCard SecureCode™ authentication data
- Process transactions using a Payment Application Best Practices (PABP) certified software solution

Accept multiple payment types with one software package

- All major credit card types

- Private label cards
- Check guarantee transactions
- American Express®, Visa® and MasterCard® Level II Purchase card functionality
- Recurring payments

ICVERIFY Enterprise system management is easy with the intuitive user interface and server status window which provide overall performance, status and event history at a glance. The number of merchant accounts supported is limited only to available system resources. The Windows® - based user interface provides access to account management and the Windows-based client software allows merchants to browse, edit and manage transactions.

Extensive security features

Application access, data storage and transaction transmission have been PABP-assessed and certified.

ICVERIFY® Enterprise Edition offers superior performance and reliability with an easy to use centralized transaction database and user friendly software.

Centralized payment applications

ICVERIFY Enterprise software integrates all payment applications - including e-commerce sites, call centers, interactive response systems and physical stores - within an enterprise into a single payment server. Client-server architecture means reconciliation is simple with a centralized transaction database. Application access across multiple clients can be centrally administered and managed.
